

UCSD Physics 10

**Into Innerspace**  
An overview of the femto-cosmos

UCSD Physics 10

### The Search for Basic Constituents Traces Back to Greek Times

- Atomic Hypothesis from Democritus
- How many “basic” constituents should we expect?
  - Air
  - Fire
  - Earth
  - Water

Say the Greeks

Spring 2008 2

UCSD Physics 10

### Atoms make up the everyday material world

- Crystalline arrays – solids
- Loose atoms rattling around – gases
- Sloppy arrangements of atoms – liquids
- We’re going to skip over intermediate length scales (biology, materials science, chemistry, condensed matter physics...) and go straight to the atomic scale
- Used to be, we’d say you can’t “see” atoms, but now we can! (Atomic Force Microscopy)

Spring 2008 3

UCSD Physics 10

### Atoms can now be “seen”

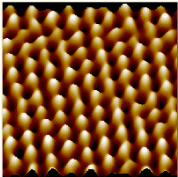

Image of individual atoms in Mica (from [www.di.com](http://www.di.com), Digital Instruments)

see also <http://stm2.nrl.navy.mil/how-afm/how-afm.html>

Spring 2008 4

UCSD Physics 10

### Atoms Are Composite Objects

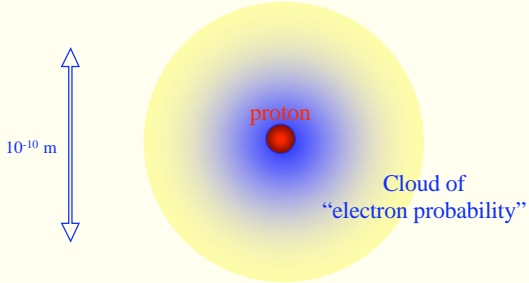

- **Protons** (+ electric charge), **p** 
- **Electrons** (– electric charge), **e** 
- **Neutrons** (no charge), **n** 
- **Proton** and **Neutron** have about the same mass
- **Electron** is about 2000 times less massive than **proton**
- Electrical Forces produce attraction between **electrons** and the **protons** in the nucleus (they are oppositely charged)

Spring 2008 5

UCSD Physics 10

### Chemical elements are defined by the number of protons in the atom's nucleus

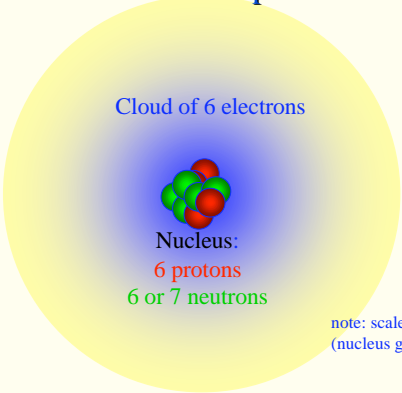

- **Hydrogen: 1 proton & 1 electron**

Spring 2008 6

UCSD Physics 10

### Carbon has 6 protons

Cloud of 6 electrons

Nucleus:  
6 protons  
6 or 7 neutrons

note: scale is wrong  
(nucleus greatly exaggerated)

Spring 2008 7

UCSD Physics 10

### The physics of atoms and their nuclei is well understood

- **The breakthroughs were made in the 1920's – 1930's**
  - Quantum Mechanics – discrete energy levels
  - Relativity – things are different when you're really zipping!
- **Evidence for depth of understanding is all around you**
  - Lasers
  - Microwave ovens
  - X-ray imaging
  - Fluorescent lights
  - Nuclear power
- **Quantum Mechanics helps us understand the basic properties of atoms, and explains the grouping in the Periodic Table**

Spring 2008 8

UCSD Physics 10

### Periodic Table of the Elements

Spring 2008 9

UCSD Physics 10

### What about the constituents of atoms?

- Separate an electron from the atom for study...

Spring 2008 10

UCSD Physics 10

### Electrons Appear to be Fundamental

- As far as we can tell, electrons have no ingredients
- The lack of substructure makes them useful probes for other particles
  - Flung them really hard at nuclei to see if they “hit” anything
  - Electron microscopes
  - Particle accelerators

Spring 2008 11

UCSD Physics 10

### What about substructure in protons and neutrons?

- Can whack **protons** and **neutrons** with **electrons** and see what happens....

“Deep Inelastic Scattering” experiments indicate the **electrons** occasionally strike hard nuggets in the proton

Quarks!

Spring 2008 12

UCSD Physics 10

### The Elementary Particles are “Related”

- Electric charge of **electron** and **proton** are equal and opposite, to remarkable accuracy
- **Neutron** left alone for 15 minutes will “Beta-decay” into **e, p, neutrino** (very light, chargeless lepton)

Spring 2008 13

UCSD Physics 10

### But that’s not all!

- **Antimatter** : Each elementary particle has an “antimatter” counterpart  
 Electron – Positron  
 Proton – Antiproton  
 Neutron – Antineutron  
 etc. – anti-etc.
- $E=mc^2$  says matter and energy are interchangeable
- If they find one another – major fireworks!

Spring 2008 14

UCSD Physics 10

### Particle-Antiparticle Dating Service: Particle Colliders

- Directing beams of particles and antiparticles at each other at ferocious energies can make new stuff
- It’s like reproducing the Big Bang, but at lower energies

Spring 2008 15

UCSD Physics 10

### Particle Accelerators are Big!

Spring 2008 16  
CERN, Switzerland

UCSD Physics 10

### Short-Lived Matter

- A veritable zoo of particles (muon, tau, mesons, hadrons....)
- Confusion in the 1960's – things seemed to be getting worse!
  - hundreds of “new” particles observed
- Recognition in 1970's, 1980's that there was order to all this mess
  - Electron has two short-lived siblings (muon, tau), each has a neutrino cousin (lepton family)
  - Nuclear matter is made up of 6 quarks, arranged as three generations with 2 members each
  - Imagine all the combinations!

Spring 2008 17

UCSD Physics 10

### The Standard Model of Particle Physics

Basic Ingredients are quarks and the electron-like objects (leptons)

Fundamental forces are mediated by photon, gluons, W's and Z's (bosons)

(Fermilab)

Spring 2008 18

UCSD Physics 10

### Quark Soup

- Combinations of quarks make up all the exotic particles cataloged in the 1960s
  - 6 quarks, 6 anti-quarks, grouped in twos and threes
  - Many dozens of combinations, only 1 or 2 stable
  - Charges always come out in integer multiples
- Examples:
  - Up, charm, top quarks have +2/3 charge
  - Down, strange, bottom quarks have -1/3 charge
  - $2u + 1d$  (uud) → proton, with +1 charge
  - $2d + 1u$  (ddu) → neutron, with neutral charge

Spring 2008 19

UCSD Physics 10

### Is There Additional Substructure?

- Much current debate on this topic
- Could all the particles be different “states” of a more basic entity? String theory suggests so.
  - 11 dimensional Universe!?
  - Particles correspond to different string vibrational modes
  - *The Elegant Universe*, by Brian Greene, describes this view
- A difficulty: seems experimentally inaccessible!
  - “Planck Scale”,  $10^{-35}$  meters, requires solar-system sized accelerator!

Spring 2008 20

UCSD Physics 10

## What holds the nucleus together?

- **Electrical charges interact, and like charges repel**
  - Opposites attract, of course
- **The closer they get, the more protons in the nucleus should be repelled from each other!**
- **Something must serve as the glue to hold the nucleus together**
  - The “strong” nuclear force: overcomes the electrical “Coulomb” force at short distances
  - Felt by quarks, not by electrons or their cousins (collectively called leptons)

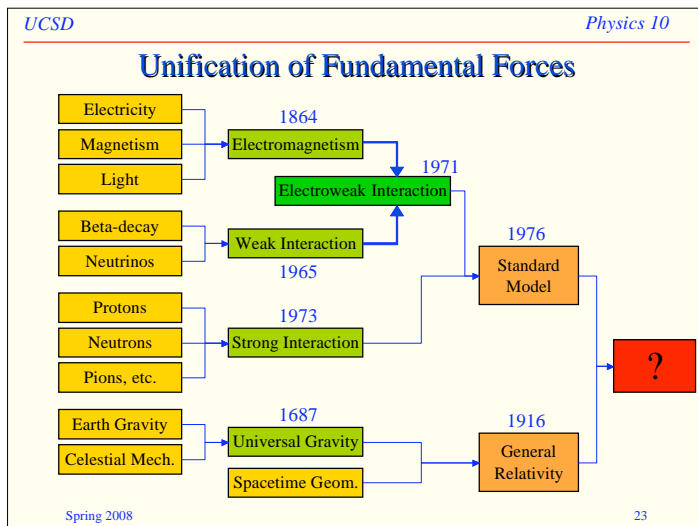

Spring 2008 21

UCSD Physics 10

## All Forces are Mediated by Exchange Particles

- **Strong nuclear force** – “gluons” (massive)
- **Weak nuclear force** – W, Z (massive)
- **Electrical and Magnetic phenomena** – photon (massless)
- **Gravity** – graviton (massless, although no one has yet seen one)
  
- **The range (extent) of the force depends on the mass of the exchange particle**
  - Which is why the strong and weak forces are remote from everyday experience, being mediated by massive particles
  - Gravity and electromagnetic forces extend infinitely far (though weaken with increased distance)

Spring 2008 22

UCSD Physics 10

## Assignments

- HW 1 due today (Now)
  - turn in at lecture, or into box outside SERF 336 by 3PM
- **Submit Question/Observation TODAY (4/11) by midnight via WebCT**
  - hard time cutoff: after this, late submission available for half credit
- HW 2: due Friday (4/18):
  - Hewitt 11.E.16, 11.E.20, 11.E.32, 11.P.5, 2.E.6, 2.E.11, 2.E.14, 2.E.36, 2.E.38, 3.E.4, 3.E.5, 3.E.6, 3.E.19
- Read Hewitt, Chap. 11, pp. 202–217
- Read Hewitt Chapters 2, 3, 4 for next week

Spring 2008 24
